## Multiple Faronics Solutions, One Faronics Core.

With a completely redesigned architecture, Faronics Core 3 is now an even more powerful and flexible platform. Offering greater enterprise deployment and management capabilities that can be tailored to each organization, Faronics Core offers centralized control of all Faronics solutions. We invite you to explore the Core!

Faronics Core provides administrators with enterprise control of multiple Faronics solutions. Its scalable architecture offers support for multiple consoles, servers, and databases to best suit the requirements of any organization with the goal of providing flexible desktop management.

## Your Product Loadin in Action

As Product Loadins, our solutions leverage the power and functionality of Faronics Core while offering product-specific features to the management platform. Immediate or scheduled tasks, reporting and workstation organization are all tailored to the unique functionality of each solution. Click on each loadin to learn more about their functionality within Faronics Core.

Faronics Core consists of four components . This tiered architecture allows for flexible management and a scalable system.

## Faronics Deep Freeze

Fran and her team have chosen to use Deep Freeze because it provides the system consistency they require to significantly reduce their support headaches. To facilitate the task of managing their Deep Freeze deployment, they've decided to

utilize Faronics Core. All the workstation information they need is easily viewed in Core Console and they've grouped all their workstations by department for easier management.

Faronics Core allows Fran's team to centrally perform or schedule Deep Freeze tasks on any number of workstations. They're able to remotely Freeze and Thaw workstations, schedule Thaws to coincide with software updates and additions, shut them down, and wake them up via Wake-On-LAN. Because of Core's Active Task feature, the team knows that all configuration changes will be applied to a workstation, regardless of whether the affected computers are currently available or not – tasks remain active until a target workstation is available.

Utilizing the status columns in Core Console, they can easily check the real-time Deep Freeze protection status across their entire deployment.

## Faronics Anti-Virus

Jerome's team is in charge of protecting his company's IT infrastructure. They had recently recognized the benefits of adopting a layered security strategy and had complemented their existing firewall by deploying Faronics Anti-Virus, Anti-Executable's application whitelisting technology, and the instant system restore offered by Deep Freeze. With a large number of workstations to keep secure, they appreciated the simplicity of managing multiple Faronics solutions from one console via Faronics Core. All the workstation information they require is easily viewed in Core Console and they've grouped all their workstations by department for easier management.

The team adopted Faronics Anti-Virus as their AV solution of choice because of its integration with Deep Freeze. Thanks to the addition of Storage Spaces in Faronics Core, they can seamlessly perform their malware definitions and program updates while their computers are protected in a Frozen state.

As well, Jerome's team can remotely perform or schedule any Faronics Anti-Virus tasks on individual workstations or any desired group. They're able to create customized policies for updating, scanning or protecting groups of computers, and turn on/off the Email and Active protection features.

Using Faronics Core reporting ability, Jerome can regularly run detailed global workstation-specific reports to provide information on scan/protection history, quarantined files, threat severity, and affected workstations.

All Faronics Anti-Virus updates are hosted on Faronics Core Server so workstations can access them directly, and because of Core's Active Task feature, the team knows that all configuration changes will be applied to a workstation, regardless of whether the affected computers are currently available or not. Tasks remain active until a target workstation is available which is particularly useful with laptops that are taken home.

As the company grows, Jerome knows he will be able to set up multiple Core Consoles so that departments can monitor and manage their own layered security deployment. Faronics Core's [scalable architecture](#) simplifies this process greatly.

## Faronics Power Save

Recently John's company adopted a vigorous green initiative aimed at reducing waste as well as saving money where possible. As the head of the IT department, he was put in charge of lowering the energy costs and waste of the organization's IT systems. This led him to choose Power Save for its intelligent PC power management capabilities. With a large number of workstations of various types spread across the organization, being able to manage their Power Save deployment via Faronics Core was key. All the workstation information they need is easily viewed in Core Console and they've grouped all their workstations by department for easier management.

Faronics Core allows John's team to remotely perform or schedule any Power Save tasks on any number of workstations. They're able to put the computers to sleep, shut them down and wake them up via Wake-On-Lan. Because of the Core's Active Task feature, the team knows that all configuration changes will be applied to a workstation, regardless of whether the affected computers are currently unavailable or not – tasks remain active until a target workstation is available.

Using the Faronics Core reporting ability, John's team regularly outputs detailed energy savings reports that allow them to track overall savings of all their Mac OS X and Windows-based computers as compared to their initial baselines. They also appreciate seeing the equivalent environmental benefits in the savings reports. Utilizing Core's ability to create Multiple Power Plans and Policies, they've implemented customized levels of energy management which are applied to best suit their organization's usage patterns.

With the company's upcoming expansion, the next step will be to set up multiple Core Consoles so that each department can monitor and manage their own power savings. The Core's [scalable architecture](#) will make this process a breeze.

## Faronics Anti-Executable

As the group in charge of the company's IT security, Evelyn, a Certified Information Systems Security Professional (CISSP), and her team have adopted a layered security strategy combining firewalls, anti-virus and the robust protection of Anti-Executable's application whitelisting technology. With a large number of workstations to keep secure, they have appreciated how they can manage their Anti-Executable deployment via Faronics Core. All the workstation information they need is easily viewed in Core Console and they've grouped all their workstations by department for easier management.

Evelyn's team can remotely perform or schedule any Anti-Executable tasks on any number of workstations. They're able to turn on/off whitelisting protection, put the computers into [Maintenance Mode](#) so that software updates and installation of new software can be easily applied, export/import whitelists, and remotely scan any managed workstation(s) to create unique whitelists. Because of Core's Active Task feature, the team knows that all configuration changes will be applied to a workstation, regardless of whether the affected computers are currently available or not – tasks remain active until a target workstation is available.

Using the Faronics Core reporting ability, Evelyn's team regularly exports [log records of violation attempts](#) that allow them to track what executables have been blocked, which user was active during the attempt, and when the violation occurred.

Because they also have Faronics Deep Freeze deployed, they're also very pleased that Anti-Executable automatically enters Maintenance Mode when it detects that a Deep Freeze Maintenance Event has Thawed the computer and applies any added applications to the workstation's whitelist.

With the recent acquisition of an overseas subsidiary in a region of high PC malware activity, the need to maintain corporate network integrity makes Faronics Anti-Executable an obvious choice. The next step will be to use Core's [scalable architecture](#) to set up multiple Core Consoles so that the new location can monitor and manage their own layered security.

## Faronics WINSelect

WINSelect has provided Peter and his team with an easy way to standardize his users' environments without the complexity of Group Policy Objects. To further simplify this process they are managing their WINSelect deployment with Faronics Core. All the workstation information they need is easily viewed in Core Console and they've grouped all their workstations by department for easier management.

Faronics Core allows Peter's team to centrally perform or schedule any WINSelect tasks on any number of workstations. They're able to remotely lockdown their workstations via customized templates, set restriction times and levels, apply configuration changes without the user having to logoff, and remotely scan a computer and select the programs which are allowed and not allowed to run. Because of Core's Active Task feature, the team knows that all configuration changes will be applied to a workstation, regardless of whether the affected computers are currently available or not – tasks remain active until a target workstation is available.

Faronics Core allows Peter's team to monitor and control workstations that have been set in "Kiosk Mode" and [configure User Session settings](#) to enforce time limits on workstation usage. Using the Faronics Core's Active Directory integration, the team can also import ADM templates to control any Microsoft product as well as import Microsoft Vista GPO's to control workstation functions.

With the organization's upcoming expansion, the next step will be to set up multiple Core Consoles so that each department can monitor and manage their own user controls. Core's [scalable architecture](#) will make this process a breeze.

## Reduce IT Support for Mac

### Costs & Requests

Faronics Deep Freeze Mac helps eliminate workstation damage and downtime by making computer configurations indestructible. Once Deep Freeze Mac is installed on a workstation, any changes made to the computer—regardless of whether they are accidental or malicious—are never permanent. Deep Freeze Mac provides immediate immunity from many of the problems that plague computers today—accidental system misconfiguration, malicious software activity, and incidental system degradation.

Deep Freeze Mac ensures computers are absolutely bulletproof, even when users have full access to system software and settings. Users get to enjoy a pristine and unrestricted computing experience, while IT personnel are freed from tedious helpdesk requests.

### Balancing Security with Productivity

Deep Freeze Mac is the only solution that effectively balances workstation security with user productivity. By mapping user and application data to a Thawed (unprotected) partition or drive, users are able to store their documents, pictures, music, etc., while still enjoying the total system consistency that Deep Freeze Mac offers.

### Flexible Resiliency

Deep Freeze Mac offers flexible scheduling options that enable IT administrators to easily create automated update and maintenance periods. System updates on computers protected by Deep Freeze Mac can be easily scheduled through Apple Remote Desktop.

## Key Features

### Absolute Protection

- Guarantees 100% workstation recovery on restart
- Provides password protection and complete security
- Protects multiple hard drives and partitions

### Configuration Options

- Supports multi-boot environments
- Customize user name and password
- Choose whether the Deep Freeze icon will appear in the menu bar
- Choose whether the hard drive icon will appear with the Deep Freeze badge

### Control and Flexibility

- Use ThawSpace to designate global or user-specific spaces for retaining data
- Selectively Freeze or Thaw fixed drives, volumes, or partitions
- Import or export configuration files to or from other Deep Freeze Controllers

- Use Deep Freeze Assistant to create customized installation packages with all desired options pre-configured
- Schedule multiple maintenance periods to automatically pull down persistent Apple Software Updates
- Add or delete Global and Individual ThawSpaces from within the ThawSpace tab in the Deep Freeze Controller
- Create ThawSpaces from 1 MB to 120 GB in size
- User specific ThawSpaces protect from unauthorized access

#### Retain User Data

- Choose from mapping specific accounts, or specific parts of a user account to a second partition or ThawSpace
- Account types include Admin, Standard and Mobile accounts

#### Integration and Compatibility

- Get enterprise-style capability with Apple Remote Desktop (ARD) integration
- Use Deep Freeze Assistant to install Saved Tasks in the ARD console
- Compatible with Mac OS X 10.4 (Tiger), 10.5 (Leopard) and 10.6 (Snow Leopard)
- Universal binary for Intel-based and PPC-based Macs
- Manage Deep Freeze Mac through the LANDesk® Management Suite console
- Use LDAP, Active Directory, and Open Directory accounts without limitation

#### Dual-Boot Support

- Deep Freeze Mac will protect your entire Mac partition, including any virtual machines within it
- Deep Freeze for Windows can be used to protect Parallels, VMWare, Boot Camp, and Virtual PC environments

## Deep Freeze for Windows

Deep Freeze for Windows

[Compare Standard and Enterprise Editions](#)

[Deep Freeze for Windows Server](#)

[Compare Server Editions](#)

Faronics Deep Freeze makes computer configurations indestructible and prevents against unwanted workstation changes—regardless of whether they are accidental or malicious. Deep Freeze is proven to reduce helpdesk support incidents and allows IT personnel to focus on more strategic IT needs.

With its reboot to restore technology, Faronics Deep Freeze offers the strongest protection available and eliminates the need for IT professionals to reconfigure, re-image, or troubleshoot computers, reducing support incidents by up to 63%.

Faronics Deep Freeze makes computers indestructible and prevents against workstation damage. It does this by ensuring each and every desktop, laptop, and server always remain in the same perfect original operating state. Deep Freeze

ensures 100% workstation recovery on every restart and is the only solution that effectively balances workstation security with user productivity. A bulletproof computer is your best defence against unwanted or unwelcome changes.

IT personnel don't need to worry about file congestion, system configuration changes, undesired applications/software, or hard drive degradation because Deep Freeze ensures unwanted personal information is never retained by the computer. Deep Freeze allows IT personnel to focus and work on more strategic IT needs for the organization rather than respond to avoidable help-desk requests. Deep Freeze users manage up to 12% more desktops per employee.

## Education

Computers in education environments are among the toughest IT environments to manage and secure. The large number of daily users, the limited resources of on-site staff, and the immense number of computers and labs that technology personnel must manage all come together to create an IT 'perfect storm'. IT personnel cannot afford to have computer systems down for long—students use computers in schools to conduct research and complete assignments; instructors need computers to record grades and organize their lessons; administrative staff need their workstations to complete their job function.

### Computer Labs

Deep Freeze makes it easy for IT administrators to create bulletproof computer labs that deliver trouble-free computing to instructors and students. Deep Freeze ensures that students are able to use public access computers with the assurance that their session will be free from accidental system misconfiguration, malicious software activity, and incidental system degradation. Personal information is never retained by the computer, which means IT personnel don't need to worry about desktop computers becoming congested with student projects and files. Computing environments become easier to manage, and expensive computer assets are kept running at 100% capacity.

Deep Freeze's ability to prevent stability degradation ensures that scholastic computer labs are able to provide the same experience over and over again regardless of the user on the desktop—an important prerequisite to successfully teaching a classroom concept.

### Administrative Machines

Deep Freeze is not just for student machines; it can also be used on instructor and employee computers. Since Deep Freeze offers flexible options for saving user data, it becomes easy to secure a workstation with total resiliency while still enabling users to save their work. Instructors and staff enjoy the assurance of knowing their computers will never fail them, and IT personnel are freed from having to deal with tedious helpdesk requests.

### Libraries

Deep Freeze ensures that students and staff enjoy a trouble-free library computing experience. Students are able to use library computers with the assurance that their session will be free from malicious software and system slowdowns. IT personnel can rest easy with the knowledge that Deep Freeze makes media computers immune from system slowdowns and software corruption caused by students accessing online media resources during their research.

**Lighter. Faster. Better.**

With the approximate annual cost of cyber crime at \$3.8 million per year, Malware is among the leading cause of corrupted PCs, damaged applications, and loss of productivity.

## Faronics Anti-Virus can help.

Faronics Anti-Virus offers a welcome shift in security solutions. Conventional security suites are often technologies acquired over time and cobbled together to complement anti-virus. Faronics Anti-Virus has been developed from the ground up and combines anti-virus, anti-spyware, and anti-rootkit technology to provide a coordinated, pre-emptive response to advanced malware. It is up to 300% faster and offers the best value of any competing anti-virus solution.

Its most innovative feature allows it to integrate seamlessly with Faronics Deep Freeze, so anti-virus updates can be applied even while computers are protected in a Frozen state (protected by Deep Freeze).

## Performance

- High scan speed
- Low RAM usage
- Low CPU consumption
- Small disk footprint

## Deep Freeze Integration

- Apply Anti-Virus signature/definition updates on Frozen computers
- Deep Freeze maintenance periods are no longer necessary

## Eliminate Threats To User Productivity

Faronics Anti-Executable and its application whitelisting technology ensures endpoint security and productivity by only allowing approved applications to run on a computer or server. Any other programs — whether they are unwanted, unlicensed, or simply unnecessary—are blocked from ever executing.

Application whitelisting also enforces compliance with organizational IT policies. Organizations benefit from productive user sessions each and every time, while IT personnel are guaranteed that desktop computers, notebooks, and servers are compliant with acceptable use policies, regulatory requirements, and software deployment schedules.

## The Layered Security Approach

With the number and complexity of malware threats steadily increasing, relying solely on definition-based anti-malware solutions to ensure IT security is no longer enough. Anti-Executable offers a necessary additional layer of protection to the existing "blacklist" solutions such as anti-virus - without the need for definition updates.

## Balancing Security with Flexibility

Anti-Executable makes applying Windows and third-party updates easy and effortless. On demand or scheduled maintenance modes allow for application updates and additions with automatic white list population.

Visit the [Key Features](#) page for a full listing of Anti-Executable's capabilities and options for the two Windows editions: Standard and Enterprise. These features also apply to the Standard and Enterprise versions of Anti-Executable Server.

## Take Control of Instructional Computers

**See how Insight nurtures classroom success!**

Faronics Insight changes the way that technology is viewed in the classroom by turning standard computer labs into collaborative learning environments. Insight is the ultimate classroom technology management solution that empowers instructors with the ability to educate, assist, monitor, and communicate with an entire class from one central computer. Instructors no longer need to deal with classroom distractions—such as games, instant messaging, and web surfing—when teaching a class. Insight makes it easy for instructors to monitor user computers; blank user screens; mute audio; remote into their computers; open, close, block applications and web activity on user workstations.

Insight's classroom collaboration options are just as powerful as its classroom control features. Instructors are able to share their screen with users, or with their supervision, let users share their screen with other users. Communication efficiency is increased with the ability to send and collect files, chat with users, broadcast messages, and hold classroom votes and student testing.

Visit the [Key Features](#) page for a full listing of Insight's capabilities and options. Faronics Insight works with any combination of computers running Windows 2000/XP/Vista/7 and Mac OS X (10.4 and higher), and also supports thin and fat client environments using Windows 2003 Terminal Server or NComputing solutions.

## Insight Benefits

- Empowers teachers with control over classroom technology and student attention
- Fosters cooperative classrooms where learning is achieved through interaction and collaboration
- Strengthens teaching effectiveness with the ability to monitor student progress
- Ensures students are kept on task and engaged in an environment where technology accelerates their learning experience
- Improve classroom computer management without increasing network load

## Education

Computers have the power to enhance the classroom experience for both students and teachers, but the benefits can easily be lost to distractive elements such as games, instant messaging, and web surfing. Instructors often have to deal with students who are not paying attention to classroom instruction, which makes it difficult to teach classes effectively.

### Empowering Teachers With Control

Trying to coordinate simple tasks—whether it is having students open a website and then navigate through to the required page or trying to have them type in a complex URL—can often become a tedious and time-consuming task for teachers. Insight changes all this by delivering total control over classroom computers into the hands of the instructor. With Insight, teachers can easily launch applications and websites on all student workstations from a central teacher console. Teachers no longer need to deal with distractions when teaching—such as students surfing the Internet, typing on the keyboards, clicking their mice, and playing games. By blanking student screens, teachers can lock students out of their computers when they should be paying attention, and can monitor multiple student computers through Insight's thumbnail viewing feature. Teachers can also monitor the running applications and Internet history on classrooms computers to ensure students are on task.

### Enhancing The Student Learning Experience

Insight enhances the learning experience for students by turning standard computer labs into interactive learning environments. Students are able to request and receive help directly in their workstation session, and appreciate the discretion that the instructor chat feature offers. They can discuss course material and ask questions without leaving their workstations and without disturbing other students. The anonymity that the voting feature provides students allows them to often times provide a more accurate answer to questions posed to the class. Students can also develop their leadership skills by sharing their screen with other students (under teacher supervision) and share their knowledge with the rest of the class.

### Advancing Technology Without Increasing Complexity

The entire Insight user interface was designed with teachers in mind, which is why it is so intuitive to use. Within just a few minutes of using Insight, teachers become familiar with how Insight works and the features that are available. Insight's learning curve and network bandwidth requirements are a fraction of that required by competing products—making it extremely popular with IT personnel who want to deploy an easy-to-use teaching product that won't generate helpdesk requests or slow network traffic.

Faronics Insight runs on Macs and Windows-based computers and now supports Apple's iPad, iPhone, and iPod.

## Reduce IT Energy Costs and Waste

Over a year, a typical desktop PC can consume up to \$100 in energy costs and 870 kilowatt hours of electricity! Faronics Power Save significantly reduces these numbers.

Power Save delivers PC power management that does not interfere with user or IT requirements. Power Save keeps computers running when users need them and accurately determines when computers are inactive so they can be powered down.

### Intelligent PC Power Management:

- Analyses CPU, disk, keyboard, mouse, network, and critical application activity before taking power management actions
- Saves open user documents prior to powering down computers
- Maximizes PC energy savings via Power Policies
- Scheduled workstation wakeups remotely using Wake-On-LAN or locally via Windows
- Gives users the ability to temporarily exempt their computers from power management
- Works with both Windows and Mac computers
- Runs Audit reports prior to activation to determine potential savings without affecting workstations
- Definitely proves its rapid return-on-investment through network-wide power consumption and savings reports
- Allows all workstations to be efficiently managed via Faronics Core

*With an average savings of \$50 per computer per year for every computer deployed, Power Save is the ultimate PC power management software solution for desktop and laptop computers.*

Visit the [Key Features](#) page for a full listing of Power Save's capabilities and options.

## Education

Every educator is concerned about the budget—year after year administrators are pressured to keep school operations running smoothly with less and less money. One area of recognized savings has always been the classroom computers. By reducing desktop power consumption, schools can reduce their energy bill. Most schools have found this to be difficult to implement as the standard energy saving features that come with computers are disruptive to user and IT activity. Users can not afford to have computers power down during classroom activities or assignments, and IT personnel require computers to be on during maintenance and update sessions. Forced to leave the computers running all day and night, IT is either unable or unwilling to power computers down when they are not in use.

### Non-Disruptive Energy Management

Power Save is designed to look at CPU and Disk Utilization thresholds that IT administrators can set so that Power Save will not shut down computers if background jobs such as VPN, remote access, and remote backup are running. Power Save allows IT administrators to specify critical programs that are exempt from power down if they are running. CPU and Disk Utilization combines with this feature to ensure that systems are not powered down when students or teachers do not want them to. Power Save also supports Standby (recommended) and Hibernate power modes to ensure that any unsaved student or teacher data is not lost.

The ability to schedule Power Save configuration updates on a single, daily, weekly, or monthly basis allows IT administrators to effortlessly make changes to enterprise energy management policies.

### Verifiable Savings

Power Save generates accurate reports detailed by computer and monitor that show the incremental savings gained through the use of Power Save in both kWh and \$; this data can be exported to any other reporting tool for additional analysis.

Power Save's Audit Mode provides a baseline measure of the energy being consumed, making it easy to determine the true value of the savings generated when Power Save's features are enabled.

### Rapid Return-On-Investment

The average return-on-investment for a Power Save deployment is 4 months—less if schools take advantage of energy rebate programs. Faronics has partnered with the largest energy utilities in North America to offer rebates that make Power Save free or available at a 50% discount. Faronics and its channel partners are also able to assist you with the paperwork to make this process easy and quick, and eliminate problems where rebates return to general revenue instead of your departmental budget.

## Lockdown Computers Quickly & Easily

WINSelect makes it easy to manage the functionality of computers in a public access, kiosk, or library environment by delivering full control over computer system settings. Administrators can also selectively control third-party programs, regulate user activity, and lockdown Windows functions.

Standardized user environments are critical for organizations that want to reduce IT support costs and workload. Faronics WINSelect provides a quick, flexible, and scalable way to configure the functionality and feature set of any Windows computer to conform to an organization's requirements. WINSelect also complements, manages, extends, and often replaces Group Policy Objects (GPO). It works alongside existing policies and delivers features and capabilities not offered by GPOs.

WINSelect is also an easy to use GPO alternative for those that want to customize or lockdown computers, but do not have the time and training to use Group Policies or lack an Active Directory structure.

## Replace GPOs

WINSelect is an easy to use alternative to Group Policy Objects. Instead of investing the time and training required to understand and manage GPOs, organizations can use WINSelect to customize or lockdown computers through an intuitive and non-technical interface. Many of the common customizations that Group Policy Objects are traditionally used for are also found in WINSelect, such as modifying Start button functionality, enforcing Windows Explorer restrictions, and limiting right-click functionality. By using WINSelect, you can create the same tailored computing environment as a Group Policy Guru, but in a fraction of the time and effort.

Visit the [Key Features](#) page for a full listing of WINSelect's capabilities and options for the two Windows editions: Standard and Enterprise.

## Authorized Devices Only Beyond This Point

Faronics Device Filter empowers IT administrators with the ability to block peripheral devices from connecting to desktop computers. Any peripheral device—such as an iPod, USB drive, Bluetooth phone, or digital camera—can be managed to prevent unauthorized data transfers or connections from taking place. IT personnel are able to assign permanent, temporary, or one-time-only authorizations to devices, and can also assign constraints to filter devices or network connections based on capacity. With the ability to generate usage reports, Device Filter allows system administrators to monitor the network-wide device connections and file transfers that have taken place.

Visit the [Key Features](#) page for a full listing of Device Filter Mac's capabilities and options.

## Education

Unregulated device connectivity can cause a multitude of classroom security and productivity challenges. Never before have computers had so many connectivity options, portable storage devices been so cheap, and data transfer rates been so fast. All these factors combine to present a serious challenge to IT and instructor efforts to keep classroom computers running and student productivity high.

Portable drives represent a way by which students can bring distractions—such as games, portable applications, and music—into the classroom. For IT personnel, the primary consequence of allowing peripheral devices to connect to public-access computers is that it becomes a conduit by which malicious software can spread. Students can quickly cause accidental or malicious network havoc by plugging infected devices into multiple workstations across several computer labs.

### Protect Against Distractions

By preventing students from being able to access their peripherals via classroom computers, Device Filter helps eliminate classroom distractions—such as games on USB Drives, music from iPods, and pictures from digital cameras. Device Filter also allows schools to balance security with flexibility—instructors are able to authorize permanent, temporary, or one-time-only authorizations to devices so that students can open or save their work using a portable device if required.

### Prevent Malicious Uploading

One of the consequences of the cheap and popular nature of portable storage is that it becomes a conduit for malicious software. As soon as an employee or visitor connects a portable drive to a corporate computer, they run the risk—whether it is accidental or intentional—of infecting network systems with any malicious software on the drive. Device Filter protects against this threat by blocking all unauthorized data connections from taking place.

## Know Your Assets Inside and Out

To further our goal of simplifying the management of enterprise computing environments, Faronics System Profiler is a powerful inventory solution that identifies and stores detailed hardware and software data for every workstation across your deployment.

Because this information is stored on the central Faronics Core Database, System Profiler can quickly search your network for workstations that match specified criteria as well as run detailed reports on either present or historical hardware/software configurations. Identify changes on one workstation over time, or compare any two workstations and identify differences.

## It's in the Details

Faronics System Profiler reports can quickly relay information like:

- Computer Type
- Physical Drives
- Logical Drive Volumes
- CPU/Cache
- Motherboard/BIOS
- Memory Configuration
- Operating System
- Running Programs
- Your Faronics Software
- Installed Software
- Network Connections
- Brochures

All reports can be exported in CSV format for further manipulation or inclusion into follow-up reports.

## Faronics System Profiler allows you to:

- **Help ensure license compliance** by identifying workstations which contain legacy applications and/or out-dated software or hardware that can compromise your operations. Easily discover workstations which require updating and confirm the quantities of specific software you have deployed to avoid licensing issues.
- **Accelerate IT productivity** by automating the cumbersome process of manual IT asset inventory - say good-bye to Excel spreadsheets! Effortlessly track IT assets from a central platform and minimize errors while you identify and address workstation changes/ differences quickly.
- **Minimize business risks** with full visibility into the overall health of your workstations. Coupled with comprehensive, on-demand asset inventory reports, you can make more informed decisions on deployment needs and necessary upgrades when it's time to migrate to newer systems.

Built on [Faronics Core](#) to provide one-stop management of all your Faronics solutions, System Profiler complements your existing deployment by offering vital information that can be utilized in Deep Freeze baseline configurations, Power Save Energy Consumption Profiles, or Anti-Executable whitelists.

### Light But Still Insightful

Faronics System Profiler is a powerful, enterprise-ready inventory tool built on the Faronics Core management platform, but for a quick view of the hardware and software existing on one computer, there's **Faronics System Profiler Standard**.

System Profiler Standard is a stand-alone application that creates summary or detailed reports on the inventory of a single computer. It can also provide an easy way to see System Profiler in action.

Download Faronics System Profiler Standard [here](#).

For your enterprise deployment, download Faronics System Profiler [here](#).

### [Key Features](#)

## Easily Retain User Data (Free download)

Faronics Data Igloo allows Deep Freeze users to exempt specified data folders, entire user profiles, or even registry keys from being Frozen by redirecting them to a Thawed partition (or ThawSpace), while keeping the operating system partition completely protected.

### What's In Your Igloo?

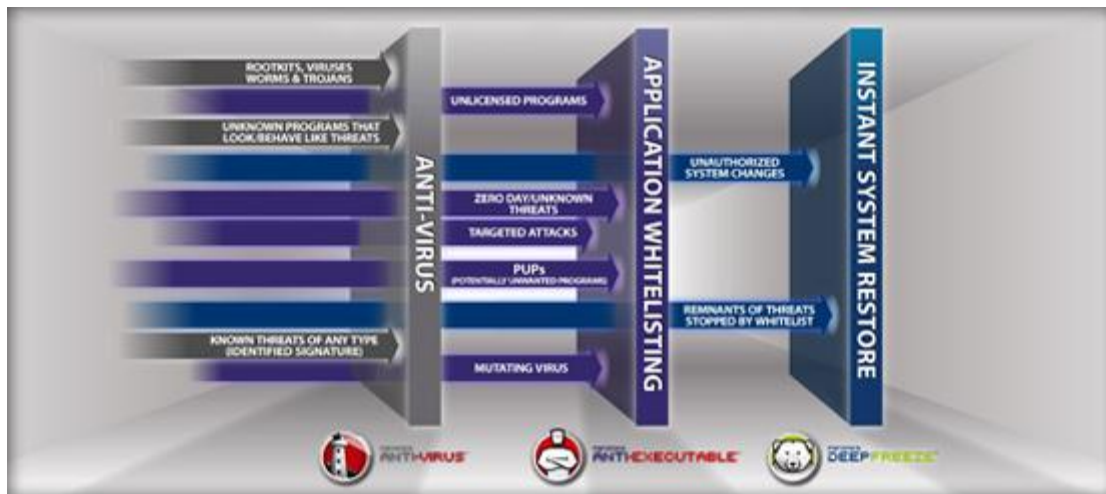

- User Profiles
- User-Created Files
- Documents
- Settings or Favourites
- Anti-Virus Updates
- Registry Keys

**Simple** – No need to learn about NTFS Junction Points or complicated procedures to create data redirection. Intuitive and easy to use, Data Igloo allows users to redirect data or user profiles in just a few minutes without any training. A simple point and click interface allows users to select the source data, select the target ThawSpace, and move the data. Any future changes or new data will automatically be redirected and saved on the designated Thawed partition.

**Seamless** – The End User is unaware of any changes as Data Igloo's redirection of data renders it invisible to the End User. Everything on the workstation looks and functions as before. End Users are not required to learn new workflows nor do they need any additional training.

**Safe** – Data Igloo allows users to retain vital data across restarts on a Frozen workstation. Since this data is stored in a Thawed partition, the operating system is still on a Frozen partition and remains fully protected. Retained data can include, user created files, documents, settings, favourites, AV Updates or even entire user profiles. You also have the option to migrate security permissions for profiles or folders, if desired.

## Faronics Layered Security Bundle for Windows

Faronics **Anti-Virus, Anti-Executable Bundle**

## Faronics Absolute Layered Security Bundle for Windows

Faronics **Anti-Virus, Anti-Executable, Deep Freeze Bundle**

## Layered Security

Relying solely on one solution to ensure security is no longer enough. Adopting a [layered security approach](#) allows IT staff to galvanize existing security policies to create an airtight defence against modern threats.

Strengthen your existing security policies while eliminating the potential headaches and high costs of repairing a compromised IT system.

### ► Accelerate IT Productivity

Every IT support ticket costs time and money. Faronics Deep Freeze automatically restores workstation configurations with every reboot, reducing IT support tickets by a documented 63%. Meanwhile the whitelisting protection of Anti-Executable reduces degradation of systems and keeps machines up and running at all times.

## ► Secure Data Endpoints Against Threats

Malware can quickly and easily degrade system performance. Protecting your workstations, Deep Freeze delivers enterprise-wide security against accidental or malicious damage with every reboot. Protecting your user sessions is Anti-Executable's whitelisting technology, which ensures only approved or wanted applications run. Finally Faronics Anti-Virus ensures known malware protection without compromising system performance.

## ► Meet Compliance Regulations

Fulfilling software and regulatory compliance requirements are quickly becoming priorities for modern businesses! By ensuring only approved applications and programs run, Anti-Executable helps to meet license and regulatory compliance regulations. Meanwhile in the event your computers are exposed to accidental or malicious third party access, Deep Freeze's reboot to restore protection ensures sensitive data is removed upon restart, helping you fulfil regulatory compliance requirements.

The layered security strategy targets every layer of potential threats, giving you peace of mind and security needed to conduct your daily business. [See the benefits►](#)

[Faronics Anti-Virus](#) halts malware threats, [Anti-Executable](#) allows only approved executables to run, and [Deep Freeze](#) provides complete system protection.
